

24 February 2020

Dear Valued Customer,

Thank you for your questions regarding the efficacy of CloroxPro™ surface disinfecting products against SARS-CoV-2 (formerly known as 2019-novel Coronavirus, or 2019-nCoV). This is a coronavirus that is responsible for the COVID-19 outbreak that began in Wuhan, China in late 2019.

To-date, SARS-CoV-2 has infected thousands of people and the associated death toll from COVID-19 is rising. Coronaviruses are typically spread through the air via coughing or sneezing, or via contact with an infected person or contaminated surfaces.

The rapidly evolving situation with the COVID-19 outbreak has triggered the EPA's Emerging Viral Pathogen Policy. This policy determines whether disinfectants that meet certain efficacy criteria can be considered effective against the novel coronavirus. Under the EPA's Emerging Viral Pathogen Policy a product is eligible and considered effective against SARS-CoV-2, an enveloped virus, if the disinfectant has an EPA-approved claim against at least one small, or one large, non-enveloped virus on the EPA Master Label. The product's EPA Master Label has a section on Emerging Pathogens that indicates which small, or large, non-enveloped virus claims advise eligibility. Eligible disinfectants must be used in accordance with the directions for use against a named small, or large, non-enveloped virus, including adhering to the contact time for the named small, or large, non-enveloped virus.

The CloroxPro™ products listed below have demonstrated effectiveness against viruses similar to SARS-CoV-2 (formerly known as 2019-nCoV) on hard, non-porous surfaces. Therefore, these products can be used against SARS-CoV-2 when used in accordance with the directions for use against the virus listed for each product in the table on hard, non-porous surfaces. For more information, refer to the CDC website at <https://www.cdc.gov/coronavirus/2019-ncov/>.
